Structural characterization of a monomeric chemokine: monocyte chemoattractant protein-3."

Chemoattractant protein-3."

FEBS LETT. 385:277-282(1996).

I FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES, LYMPHOCYTES, BASOPHILS AND EOSINOPHILS. MAY PLAY A ROLE IN NEOPLASIA AND INTEAMMATORY HOST RESPONSES. THIS PROTEIN CAN BIND HEPARIN.

I SIBUNIT: MONOMER OR HOMODIMER; IN EQUILIBRIUM.

INTESTINE AND PERIPHERAL BLOOD CELLS. INTERMEDIATE LEVELS SEN IN THE HEART, PLACENTA, LUNG, SKELETAL MOSCLE, THYMUS, COLON, OVARY, SPINAL CORD AND PRACREAS. LOW LEVELS SEEN IN THE BRAIN, LIVER,
                                                                                                                                                                                      -!- INDUCTION: BY INTERFERON GAMMA, MITOGENS AND INTERLEUKIN-1.
-!- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                CYTOKINE; CHEMOTAXIS; SIGNAL; HEPARIN-BINDING; INFLAMMATORY RESPONSE;

POTENT MONOCYTE ACTIVE CHEMOKINE THAT SIGNALS BUSINOHLLS. MONOCYTES, GREMOKINE THAT SIGNALS THROUGH CCR2. INVOLVED IN ALLERGIC INVELAMATION AND THE HOST RESPONSE TO PATHOCENS AND MAY PLAY A PLOYDAL ROLE DURING EARLY STAGES OF ALLERGIC LUNG INFLAMMATION.

-! SUBUNIT: HOWODIMER (BY SIMILARITY).

-I TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE LYMPH NODES AND FRAY, LUNG, BRAIN, SMALL INTESTINE, KIDNEY AND COLON.

-I INDUCTION: BY IFN-GAMMA AND LIPOPOLYSACCHARIDE (LDS).

-! SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY CAMAIL, CAPACTURE.
                                                                                                                                                                 J. EXP. MED. 185:99-109(1997).
-1- FUNCTION: CHEWOTACTIC FACTOR THAT ATTRACTS EOSINOPHILS, MONOCYTES,

J. BIOL. CHEM. 266:8455-8463(1991).

-!- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
RESPONSE TO AN INTEAMMATORY STIMULUS.
-!- SUBUNIT: HOMODIMER.
-!- TISSUE SPECIFICITY: ALVEOLAR MACROPHAGES.
-!- INDUCTION: BY LIPOPOLYSACCHARIDE.
-!- SIMILARITY: BELONGS TO THE INTERCRINE ALPHA FAMILY (SMALL CYTOKINE
C-X-C) (CHEMOKINE CXC).

Treatment of viral infection, e.g. HIV, and in wound healing claim it page 12-13; 21pp; English.

This protein comprises human beta-chemokine H1305, also known as claim it page 12-13; 21pp; English.

This protein comprises human beta-chemokine H1305, also known as the protein comprises human beta-chemokine H1305, also known as 191023) isolated from a claimed cDNA clone (see CDNA library. Also claimed are: (1) a host cell, preferably to an expression control sequence; (2) a recombinantly produced Specifically reacts with the H1306 polynocleotide operably linked specifically reacts with the H1305 protein. The H1305 protein and (3) a composition comprising an antibody which may be used in a composition for the treatment of a mammalian subject (claimed). It is thought to have chemokine activities and calls: It may be useful for inhibiting viral replication of blood including replication of H1V, and may also be used for treatment of specifically react with H1305. Such antibodies which therapy of certain tumours as they are capable of blocking the form the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human monocyte chemotactic proprotein - has homology to CC chemokine(s) useful for identifying agent for treating auto-immune diseases or allergic responses.

Claim 1: Pages 38-39: 53pp: English.

The is a human monocyte chemotactic proprotein sequence. Its cDNA was first identified in Incyte clone 95517 from a breast cDNA library. Antisense nucleotides can be used to control human MCPP expression especially where it may lead to inappropriate monocyte or macrophage activity causing damage associated with allergic responses to organs such as the lungs. Antisense nucleotides and MCPP cDNA may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

The present sequence represents murine monocyte chemoattractant protein 5 (MCP-5). The MCP-4 and MCP-5 have activity in stimulating chemotactic activity. The proteins can be used for treating cancers, e.g. a sarcoma, a tumour within the lung or gastrointestinal tract, or can be used for triating a melanoma, a fifectious disease such as AIDS or malaria. Antagonists to the proteins disease, cystic fibrosis, sinusitis, rhinitis, atherosclerosis, sinusitis, rhinitis, atherosclerosis, arthritis, aultiple sclerosis, inflammatory bowel disease, parabitic infections may also be treated with a molecule that inhibits
in diagnostic assays of body fluids or biopsied tissues to detect expression levels of MCPP. MCPP cDNA may also be useful for treatment of disorders such as asthma, rheumatoid arthritis, NIDDM or cancer of the breast or bladder. Human MCPP protein can be used to MCPP in allergic responses or inhibitors to modulate the activity of Sequence 109 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17-AUG-1998 (first entry)
Murine monocyte chemoattractant protein 5.
Murine; mouse; monocyte chemoattractant protein; MCP-4; MCP-5; chemokine; immune response; cancer; AIDS; malaria; parasitic infection.

Monocyte chemotactic protein-5 - used to develop products for treating e.g. immune system disorders, infections, inflammation, treating e.g. immune system disorders, infections, inflammation, and in 18 persent sequence represents monocyte chemotactic protein 5 (MCP-5).

The present sequence represents monocyte chemotactic protein 5 (MCP-5).

The MCP-5 protein stimulates chemotaxis of eosinophils, monocytes and represent invertion and so is likely to be involved with lymphocytes, but not neutrophils, and so is likely to be involved with cosinophil. monocyte- and/or lymphocyte-mediated inflammations.

Products of the present invertion can be used for tenating e.g. products of the present invertion can be used for tenating an unwanted inflammatory so or for promoting wound healing. The products can also be used for or for promoting wound healing. The products can also be used for inflammatory bowel disease, glomerular inflammation, lupus membranous nephropathy, glomerulo-sclerosis, chronic hepatic can also disease, andle trespiratory distress syndrome, sarcoidosis, pleural effusions which occur secondary to various diseases, respiratory allergies, asthmin, atherosclerosis, cardiovascular disease, arthritis, and the products can also be used for detection, diagnosis and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prolypeptide encoding chemokine beta 4 and monocyte chemotactic
prolypeptide encoding chemokine beta 4 and monocyte chemotactic
protein 4 - useful to treat tumours, autoimmune disease, infection,
asthma and fibrosis
sxample 11; fig 5; 83pp; English.
The present sequence is human chemokine betal0 (Ck betal0) or
monocyte chemotactic protein 4 (MCP-4) Dro13+ variant, which can
concept to treat patients deficient in Ck betal0, while a Ck betal0
concept to treat patients deficient in Ck betal0, while a Ck betal0
conportunistic infections, autoimmune diseases, asthma, fibrotic
diseases, psoriasis and neurodegenerative diseases. It also
promotes wound healing, regulates hematopoissis and generates
promotes wound healing, regulates hematopoissis and generates
continuodies. Labelled Ck betal0 can be used to identify its cognate
receptor, while cells expressing the receptor can be used to
compounds for (ant)agonist activity. The antagonist can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

Example 11; Fig 5: 83pp; English.

Example 11: Fig 5: 83pp; English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (MCP-4) Bac 3 variant, which can be used to treat betalo. While ack betalo.

The present sequence is human chemokine betalo, while ack betalo can be used to treat leukaemia, solid tumours, chronic or betalo can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autroimmune diseases. It also promotes wound healing, regulates hemmatopoies; and generates antibodies. Labelled Ck betalo can be used to identify its cognate compounds for (art)agonist activity. The antiagonist can be used to compounds for (art)agonist activity. The antiagonist can be used to treat rheumatoid arthritis, autoimmune, chronic inflammatory or bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betalo CDNA can component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

Example 11; Fig 5; 83pp; English.

Composite chemotactic protein 4 (MCP-4) Bac 2 variant, which can be monocyte chemotactic protein 4 (MCP-4) Bac 2 variant, which can be used to treat patients deficient in Ck betalo, while a Ck betalo.

Comtagonist can be used to reduce excessive levels of Ck betalo. Ck betalo can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases. It also cisseases, psoriasis and neurodegenerative diseases. It also promotes wound healing, regulates haematopoiesis and generates antibodies. Labelled Ck betalo can be used to identify its cognate compounds for carbigaonist activity. The antagonist can be used to screen treat rheumatoid arthritis, autoimmune, chronic inflammatory or bone marrow fallure, silicosis, sarcoidosis, hyper-eosinophilic be used to isolate genes encoding similar peptides, in gene therapy con compounds. The compound content of the compound content in the content fever and syndrome, lung inflammation and atherosclerosis. Ck betalo CbNA can and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WHISTORY 4.9.19.9.4.0.

To Protein 4 useful to treat tumours, autoimmune disease, infection, asthma and fibrosis

Example 11: Fig 5: 83pp: English.

The present sequence is human chemokine betal0 (Ck betal0) or monocyte chemotractic protein 4 (MCP-4) Drol1/2 variant, which can monocyte chemotractic protein 4 (MCP-4) Drol1/2 variant, which can be used to treat patients deficient in Ck betal0, while a Ck betal0 cc betal0 can be used to treat leukaemia, solid tumours, chronic or opportunistic infections, autoimmune diseases. It also romotes wound healing, regulates haematopoiesis and generates of compounds for (atl)agonist can be used to identify its cognate compounds for (atl)agonist activity. The antagonist can be used to compounds for (atl)agonist activity. The antagonist can be used to compound failure, silicosis, sarooidosis, hyper-eosinophilic con marrow failure, silicosis, sarooidosis, hyper-eosinophilic syndrome, lung inflammation and atherosclerosis. Ck betal0 con and atherosclerosis. Ck betal0 con and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

Corporate chemotactic protein 4 (MCP-4) Bac 1 variant, which can be monocyte chemotactic protein 4 (MCP-4) Bac 1 variant, which can be monocyte chemotactic protein 4 (MCP-4) Bac 1 variant, which can be monocyte chemotactic protein in CK beta10.

Corportunistic and fortreat leukaemia, solid tumours, chronic or cheal or an tegonist can be used to treat leukaemia, solid tumours, chronic or cheal or an encodegenerative diseases. It also promotes wound healing, regulates haematopolesis and generates antibodies. Labelled CK beta10 can be used to identify its cognate antibodies. Labelled CK beta10 can be used to identify its cognate can be used to compounds for (ant)agonist autoimmune, chronic inflammatory or creat rheumatoid arthritis, autoimmune, chronic inflammatory or

The present sequence represents a chemokine, Ckbeta-10, which is capable to mobilising stem cells. The chemokine can be used therapeutically to of mobilising stem cells. The chemokine can be used therapeutically to improve stem cell mobilisation, optionally together with a colony stimulating factor or other haematoregulatory agent. It can be used to wherever an increased level of haematopoietic cells is needed, e.g. to necrease the immune response to chronic infection (particularly bacterial or parasito), to promote wound healing, in (transplant) contents with reduced bone marrow function as a result of patients with reduced bone marrow function as a result of immunosuppressive treatment or disease, and to provide more rapid immunosuppressive treatment or disease, and to neophastic or viral diseases. The induced stem cells may be harvested for subsequent return to the patient, optionally after they have been genetically manipulated to deliver a selected gene product (gene therapy). The cells may be consequent for a deliver a selected gene product (gene therapy). The cells may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    healing, regulates haematopoiesis and generates antibodies.
Labelled Ck betalo can be used to identify its cognate receptor,
while cells expressing the receptor can be used to screen compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             claim 1. Fig 2: 83pp: English.

Claim 1. Fig 2: 83pp: English.

The present sequence is human chemokine betal0 (Ck betal0) or

monocyte chemotractic protein 4 (MCP.4), which can be used to treat

monocyte deficient in Ck betal0, while a Ck betal0 antagonist can

be used to reduce excessive levels of Ck betal0. Ck betal0 can be

used to treat leukaemia, solid tumours, chronic or opportunistic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptide encoding chemokine beta 4 and monocyte chemotactic protein 4 - useful to treat tumours, autoimmune disease, infection,

Human chemokine betal0 or monocyte chemotactic protein 4.
Human chemokine betal0; ox betal0; treatment; antagonist;
solid tumour; infection; autoimmune disease; astima; antibody;
fibrotic disease; psoriasis; neurodegenerative disease;
wound healing; haematopoiesis regulation; gene therapy;
chromosome identification; monocyte chemotactic protein 4;
leukaemia; MCP-4.
                         WPI: 97-28956/23.
WPI: 97-28956/23.
Ten new chemokine(s) able to mobilise stem cells - used where increased levels of haematopoietic cells are required, e.g. to increase resistance to infection claim 7; Page 11-12; 24pp; English.

products for treating e.g. cancers, infections, asthma, cystic fibrosis, rhinitis, atherosclerosis or infections, asthma, cystic claim 8; page 53: 106pp; English.

The present sequence represents human monocyte chemoattractant protein (NOF-4). The MCP-4 and MCP-5 have activity in stimulating chemotactic activity. The Proteins can be used for treating cancers, e.g. artivity. The Proteins can be used for treating cancers, e.g. astrooma, a tumour within the lung or gastrointestinal tract, or can be used for treating e.g. and an endoward as infectious disease such as AIDS or malaria. Antagonists to the proteins can be used for treating e.g. astrointestinal tract, or can be used for treating e.g. astrointestinal tract, or can be used for treating e.g. asthma, chronic obstructive pulmonary glomerulonephritis, multiple sclerosis, inflammatory bowel disease, arthritis or adult respiratory distress syndrome. Infections such as MCP-4 or MCP-5 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
for (ant)agonist activity. The antagonist can be used to treat infectious diseases, allergies, prostaglandin dependent fever and bone marrow failure, silicosis, sarcoidosis, hyper-eosinophilic be used to isolate genes encoding similar peptides, in gene therapy and for chromosome identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Monocyte chemoattractant proteins, MCP-4 and MCP-3 - used to develop

This Purple Comprises numen macrophage derived monocyte chemotactic protein-5 (MCP-5), a novel C-C chemokine.

Its amino acid sequence was deduced from a cDNA clone (see 19080 and T90803) isolated from a human macrophage cDNA claimed method for producing MCP-5 comprises with MCP-5 polynucleotide. Also claimed is a hybridoma that continue with the mature MCP-5. MCP-5 (or its anologues and produces a monoclonal antibody (MAb) that is specifically reactive with the mature MCP-5. MCP-5 (or its anologues and produces a monoclonal antibody (MAb) that is specifically reactive with the mature MCP-5. MCP-5 (or its anologues and reagents) is used to enhance the immune response in cases of wounds or infections, while its inhibitors (e.g. the MAb) are considered as anti-inflammatories in cases of e.g. arthritis and angiogenesis and tumour growth (or metastasis). The MCP-5 inhibitors can possibly also be used to reduce the damaging effects inhibit replication of HIV. MCP-5 can also be used to identify is ceceptors) are used to modulate MCP-5 peptides (or the analogues or MCP-5 agonists and antagonists.
                                                                                                                                                                                                                         Polynucleotide encoding monocyte chemotactic protein-5 - useful in treatment of e.g. inflammation, atherosclerosis, angiogenesis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 87; DB 28; Length 98;
